Follow the Pipes

Sometimes it's like a maze. Different kinds of pipes in the facility that extends down into a parking garage. Being able to find the problem can be a daunting task. It takes experience and special training to get the pipes to work flawlessly.

As I sit and write to you again this month, I realized that I have seldom spoke about piping. It is an instrumental part of your business carrying steam, gas, chilled and hot water throughout your facility ensuring business gets accomplished each day. Many times we take it for granted and expect it'll work. That's because you perform maintenance and check the records regularly. However, that may not be enough. When it isn't, that's when you call ACSI.

Piping is a key aspect to ACSI as we employ many experts in the field installing, maintaining and fabricating piping systems. Our main goal is to construct a system that conserves energy by using it in the most efficient manner possible.

There has been the frequent occasion when we are asked to inspect a piping system only to find steam or other leaks in the systems. Because of our expertise, we've been able to save on average 25% energy savings.

That's a good reason to have your pipes inspected annually.

I ask that you remember us the next time you're needing your pipes inspected, upgraded or repaired. All of our workers are all Local 597 highly trained union pipefitters. Give us a call.

Frank Lacny

Green Mechanical Certified

Did you read the February issue of Chief Engineer magazine?

It's true. Our project at Hinsdale Hospital was featured! Let me know if you've found the article helpful. Contact me directly at flacny@acsigroup.com.
