

## Repairing the Boiler

The boiler is the central part of your heating system. Without it functioning properly, you can be throwing away money or even endangering the health and well being of those in your building. Know the 'signs' when your boiler is in need of repair.

- Unusual odors when the heat turns on; this could be a sign of a gas leak or improper burning of fuel
- Water takes too long to heat up; Identify if it's the boiler or the controls
- Heating bill is high resulting from poor boiler performance
- Water on or around the boiler signifying a potential leak

Be sure to call ACSI to have your boiler and burner checked to maximize your energy consumption and keep operating costs as low as possible.

## Where There's a Lot of People, You Need a Lot of Fresh Air

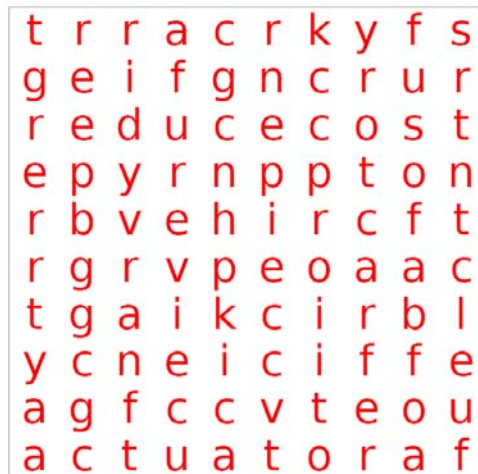

Recently, ACSI was called to a higher education facility to evaluate problems with the HVAC system.

ACSI discovered that the fresh air dampers for the HVAC system were not operating. After careful evaluation, we recommended to perform updates to the actuators on the dampers, replacing them all.

Our workers ensured that everything was fully functional and operated properly with the building management system.
