Top 9 Boiler Hot Buttons

Your boilers represent a huge investment for your facility. While the boilers are in operation, the opportunity does not exist to perform required maintenance. With the spring season upon us, (when the boilers can be shut down), be sure to perform these top maintenance tasks. Remember, these tasks should be performed at least once a year.

1. Inspect and clean both the fire and water sides of the boiler to remove any soot and/or scale.
2. Inspect refractory for cracks and other signs of deterioration. "Wash Coat" the refractory to seal & extend its service life.
3. Inspect and clean the burner externally and **Internally**.
4. Inspect, clean or replace the pilot igniter.
5. Fuel and air linkages should be checked. Worn linkage parts need to be replaced.
6. Tubes should be closely examined for leaks and cracks and repaired.
7. Inspect, test and calibrate controls and safety devices.
8. Check Safety Relief Valves for leakage.
9. Adjust the fuel/air ratio and "Tune up" the burner. Complete a written combustion analysis.

Call ACSI to get your boiler checked.
