Maximizing Efficiency in Your Boiler

There are ways to consider cost savings with your boiler system. One of the very first tasks is to determine the condition of the boiler. Is the boiler possibly scaled on the waterside? Are the tubes clean?

If the answer is yes, then the burner can be a potential option to upgrade to newer, better technology. In order to determine if a burner replacement can be a means of cost savings, ACSI

has developed an Energy Analysis form. (The form can be found at acsigroup.com) The results tell the tale.

If the results come back and show cost saving measures, then the burner is the perfect place to start. By replacing the burner, you can gain energy efficiencies anywhere from 5% - 9% annually off your fuel bill.

In addition, great savings can be obtained by installing an economizer on the stack. This is a heat exchanger that preheats the water going into the boiler, and it also reduces the stack temperatures. For every 100 degrees removed from stack gas temperature, there is approximately 3% saving. Combine this with a new burner, and it adds to the savings.

We're Home!

We've finally moved into our new home right down the street from our old location. It's bright, it's beautiful, and everyone here is pleased with their new space. If you're in the neighborhood, stop by so we can take you on the grand tour.
