## Boilers are Taking a Rest

When the boiler is taken out of service, good care is important during the idle period. It gives you an opportunity to view inside of the unit and closely inspect any wear and tear that occurs during normal operation.

- Be sure to also check for:
- Cracks in the refractory.
- Leaking and/or noisy feedwater pumps.
- Leaking Safety Relief Valves.
- Solids that may have settled on the “water side” of the boiler surface and for any “soot” on the “fire side” of the boiler.
- Check all piping, fittings and valves for leaks.
- Check your burner for worn linkage parts.

By properly servicing the boiler, burner and heating system during shut-down, will save you time and potential problems when your start up begins again. Get the burner and boiler specialists to help you achieve your goal of a problem-free environment. Contact us today as we can conduct a clean and check along with testing all the safety interlocks on your equipment.

## Summer Heat is Just About Here

*Be sure your air conditioner is ready to handle the hot summer ahead. Don't get caught in a heat wave, call ACSI today to prepare for the summer sun. Get your air conditioner checked today.*
